

## \* Task 1: Cartesian Curves

Trace the following curve.

$$2 \quad xy^2 = a^2(a-x)$$

Given eq<sup>n</sup> of curve is  $xy^2 = a^2(a-x)$

### 1 Symmetry:

In given eq<sup>n</sup> of curve we replacing  $y$  by  $-y$  and eq<sup>n</sup> remain unchanged then curve has symmetry about  $x$  axis.

### 2 Curve passing through the origin.

In eq<sup>n</sup> of curve we can see a constant then curve does not pass through the origin.

### 3 Intersection with axis.

In eq<sup>n</sup> of curve we putting  $y=0$  then we get co-ordinate point of intersection with  $x$  axis.

$$\therefore xy^2 = a^2(a-x)$$

$$\therefore 0 = a^3 - a^2x$$

$$\therefore \boxed{x = a}$$

#### 4 Asymptotes

① parallel to x axis:

$$\therefore xy^2 = a^3 - a^2x$$

$$\therefore xy^2 + a^2x = a^3$$

$$\therefore x = \frac{a^3}{y^2 + a^2}$$

$$\therefore y^2 + a^2 = 0$$

$$\therefore y = \pm \sqrt{-a}$$

② parallel to y axis

$$\therefore xy^2 = a^3 - a^2x$$

$$\therefore \boxed{x = 0}$$

5 Region, For region Form the curve eq<sup>n</sup>

$$\therefore xy^2 = a^2(a-x)$$

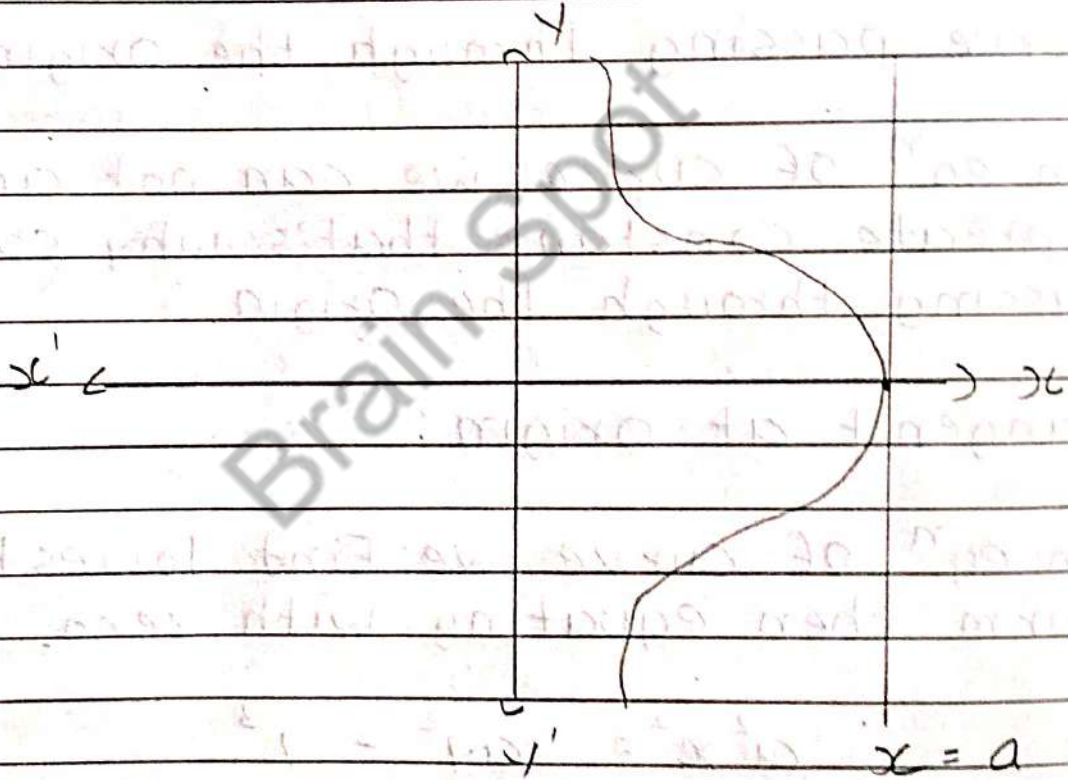

$$\therefore y^2 = \frac{a^2(a-x)}{x}$$

$$\therefore y = a \sqrt{\frac{a-x}{x}}$$

Here,  $y$  become imaginary For  $x > a$ ,  $x \leq 0$ .

So, Curve does not lies for  $x > a$  and  $x \leq 0$ .

$$3 \quad a^2 x^2 = y^2(2a - y)$$

Given eq<sup>n</sup> of curve  $a^2 x^2 = y^2(2a - y)$  - (1)

1 Symmetry:

In eq<sup>n</sup> of curve we repossing  $x$  by  $-x$  eq<sup>n</sup> of curve remain unchange then curve has symmetry above  $y$ -axis.

2 Curve passing Through the origin

In eq<sup>n</sup> of curve we can not any seprate constant that's why curve passing through the origin.

3 Tangent at origin:

In eq<sup>n</sup> of curve we Find lowest degree term then equating with zero.

$$a^2 x^2 = 2ay^2 - y^3$$

$$\therefore a^2 x^2 - 2ay^2 = 0$$

$$\therefore a^2 x^2 = 2ay^2$$

$$\therefore ax^2 = 2y^2$$

$$\therefore \pm \sqrt{ax} = \pm \sqrt{2y}$$

$$\text{So, } \sqrt{ax} - \sqrt{2y} = 0, \quad -\sqrt{ax} - \sqrt{2y} = 0$$
$$\sqrt{ax} + \sqrt{2y} = 0, \quad -\sqrt{ax} + \sqrt{2y} = 0$$

$\therefore \sqrt{ax} - \sqrt{2y} = 0$  and  $\sqrt{ax} + \sqrt{2y}$  is tangent at origin.

Here, we get 2 tangent at Origin but tangent is not equal. So, Origin is a become Node.

#### 4 Intersection with axis

① For X axis : We take  $Y = 0$  In eq<sup>n</sup> of curve.

$$\therefore a^2 x^2 = y^2 (2a - y)$$

$$\therefore a^2 x^2 = 0$$

$$\therefore x = 0$$

② For Y axis : We take  $X = 0$  in eq<sup>n</sup> of curve.

$$\therefore a^2 x^2 = y^2 (2a - y)$$

$$y^2 (2a - y) = 0$$

$$\therefore y^2 2a = y^3$$

$$\therefore y = 2a$$

Curve intersection with X axis at  $x = 0$  and Y axis at  $y = 2a$  point.

5 Region.

$$\therefore a^2 x^2 = y^2 (2a - y)$$

$$\therefore a^2 x^2 = y^2 2a - y^3$$

$$\therefore x^2 = \frac{y^2 2a - y^3}{a^2}$$

$$\therefore x = \frac{y}{a} \sqrt{2a - y}$$

Here,  $x$  become imaginary for  $y > 2a$ .  
So, Curve does not lies for  $y > 2a$ .

6 Asymptotates.

① parallel to x axis:

In eq<sup>n</sup> of curve equate highest degree  $x$  coefficient with zero

$$\therefore x^2 a^2 = 0$$

$$\therefore a^2 = 0$$

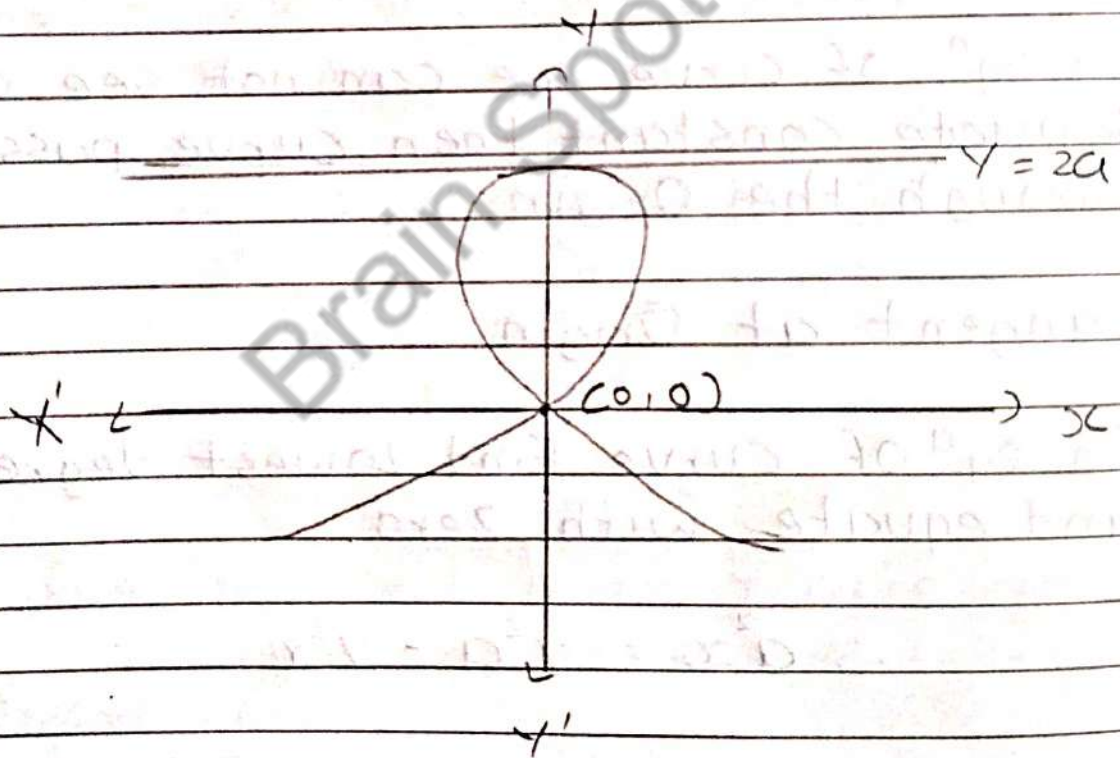

② parallel to Y axis:

In eq<sup>n</sup> of curve equate highest degree Y coefficient with zero.

$$\therefore -y^3 = -1$$

$$\text{So, } -1 \neq 0$$

Asymptotes is does not exist at parallel to Y axis and X axis.

$$4 \quad ay^2 = a^2x = y^2(ca-x)$$

Given eq<sup>n</sup> of curve  $a^2x = y^2(ca-x)$  - (1)

### 1 Symmetry:

In eq<sup>n</sup> of curve we replacing  $y$  by  $-y$  then eq<sup>n</sup> of curve remain unchange then curve has symmetry above  $x$  axis.

### 2 Curve passing through the Origin.

In eq<sup>n</sup> of curve we can not see any separate constant then curve passing through the Origin.

### 3 Tangent at Origin.

In eq<sup>n</sup> of curve Find lowest degree term and equate with zero.

$$\therefore a^2x = y^2a - y^2x$$

Lowest degree term is  $a^2x = 0$

$$\therefore x = 0$$

## 4 Intersection with axis,

① For X axis: In eq<sup>n</sup> of curve we take  
 $y = 0$

$$\therefore a^2 x = y^2 (a - x)$$

$$\therefore x = 0$$

Curve intersect with x axis at Origin

② For Y axis: In eq<sup>n</sup> of curve we take  
 $x = 0$

$$\therefore a^2 x = y^2 (a - x)$$

$$\therefore y^2 a = 0$$

$$\therefore y = 0$$

Curve intersect with Y axis at Origin

## 5 Region:

$$\therefore a^2 x = y^2 (a - x)$$

$$\therefore y^2 = \frac{a^2 x}{a - x}$$

$$\therefore y = a \sqrt{\frac{x}{a - x}}$$

$y$  become imaginary For  $x = a$ ,  $x > a$ ,  $x < 0$ .

### 6 Asymptotes :-

1 parallel to  $x$  axis:

In eq<sup>n</sup> of curve equate highest degree  $x$  coefficient with zero.

$$a^2 x = y^2 a - y^2 x$$

$$\therefore a^2 x + y^2 x = y^2 a$$

$$\therefore x = \frac{y^2 a}{a^2 + y^2}$$

$$\therefore a^2 + y^2 = 0$$

$$\therefore y = \pm \sqrt{-a^2}$$

2 parallel to  $y$  axis:

In eq<sup>n</sup> of curve equate Highest degree  $y$  coefficient with zero.

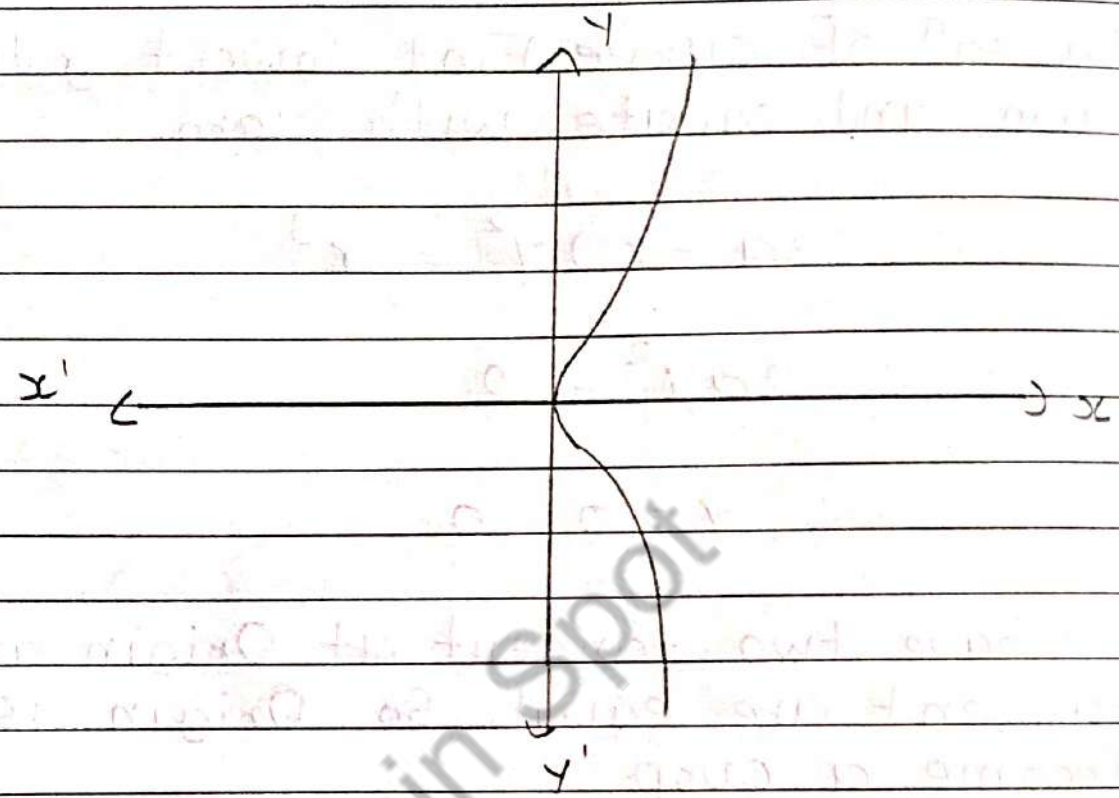

$$a^2 x = y^2 (a - x)$$

$$\therefore a - x = 0$$

$$\therefore x = a$$

Asymptotes is not exist at parellel to X axis It is exist at parelle to Y axis.

1  $(2a-x)y^2 = x^3$

Given eq<sup>n</sup> of curve  $(2a-x)y^2 = x^3$  - (1)

1 Symmetry:

In given eq<sup>n</sup> of curve we replasing Y by -Y then eq<sup>n</sup> remain unchange. So, Curve has Symmetry above X axis.

2 Tangent at Origin:

In given eq<sup>n</sup> of curve we can see that any constant term is not seprete.

in eq<sup>n</sup>. So, Curve has tangent at origin.

### 3 Tangent at Origin

In eq<sup>n</sup> of curve Find lowest degree term and equate with zero.

$$\therefore (2a - x)y^2 = x^3$$

$$\therefore 2ay^2 = 0$$

$$\therefore y = 0, 0$$

We have two tangent at Origin and tangent are equal. So, Origin is become a cusp.

### 4 Intersection with axis

① For X axis: In eq<sup>n</sup> of curve putting  $y=0$

$$\therefore (2a - x)y^2 = x^3$$

$$\therefore x^3 = 0$$

$$\therefore x = 0$$

② For Y axis: In eq<sup>n</sup> of curve putting  $x=0$ .

$$\therefore (2a-x)y^2 = x^3$$

$$\therefore 2ay^2 = 0$$

$$\therefore y = 0$$

Intersection with axis Curve has  
Intersect with y and x axis at  
Origin.

5 Region:

$$(2a-x)y^2 = x^3$$

$$\therefore y^2 = \frac{x^3}{2a-x}$$

$$\therefore y = x \sqrt{\frac{x}{2a-x}}$$

y become imaginary for  $x > 2a$ .

6 Asymptotes:

① parallel to x axis: In eq<sup>n</sup> of curve  
equate highest degree x coefficient  
with x = 0

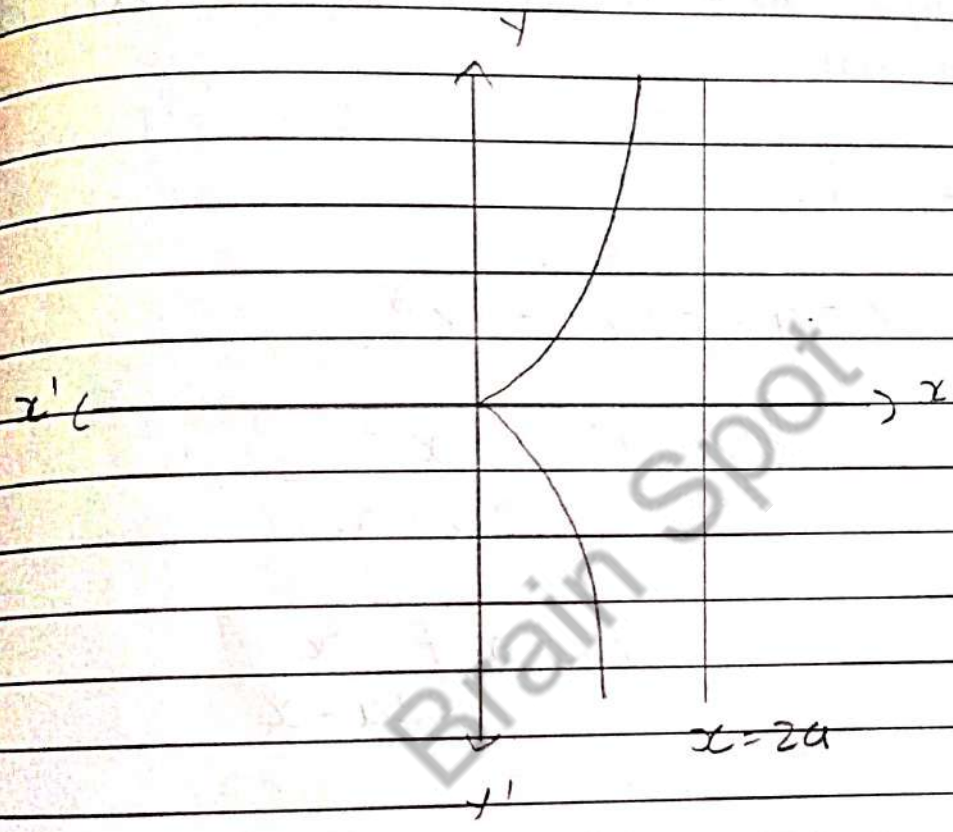

$$\therefore x^3 = 0$$

$$\therefore x = 0$$

parallel to Y axis : In eq<sup>n</sup> of curve equate highest degree Y coefficient with 0

∴ 2a - x = 0

∴ x = 2a

5  $9ay^2 = x(x - 3a)^2$

Given eq<sup>n</sup> of Curve  $9ay^2 = x(x - 3a)^2$  - (1)

1 Symmetry : In given eq<sup>n</sup> of curve we replasing y by -y then eq<sup>n</sup> of curve remain unchange.

So, Curve has symmetry above X axis.

## 2 Curve passing through the Origin.

In eq<sup>n</sup> of curve we can see that any constant term does not separate in eq<sup>n</sup>. So, Curve passing through the Origin.

## 3 Tangent at Origin:

In eq<sup>n</sup> of curve Find lowest degree term and equate with zero.

$$\therefore gay^2 = x(x^2 - 6xa + 9a^2)$$

$$\therefore gay^2 - x^3 + 6x^2a - 9a^2x = 0$$

here, lowest degree term

$$\therefore -9a^2x = 0$$

$$\therefore x = 0$$

Curve has tangent at Origin.

## 4 ~~Intersection with axis~~ Asymptotes

① For X axis: In eq<sup>n</sup> of curve equate highest degree X coefficient with zero.

$$\therefore x^3 = 0$$

$$x = 0$$

② For y axis: In eq<sup>n</sup> of curve equate highest y coefficient with 0

$$\therefore -9ay^2 = 0$$

$$\therefore y = 0$$

Asymptotes is exist for X and Y axis.

5 Intersection with axes

① For X axis: In eq<sup>n</sup> of curve putting  $y = 0$

$$\therefore x(x - 3a)^2 = 0$$

$$\therefore x = 3a$$

② For Y axis: In eq<sup>n</sup> of curve putting  $x = 0$

$$9ay^2 = 0$$

$$y = 0$$

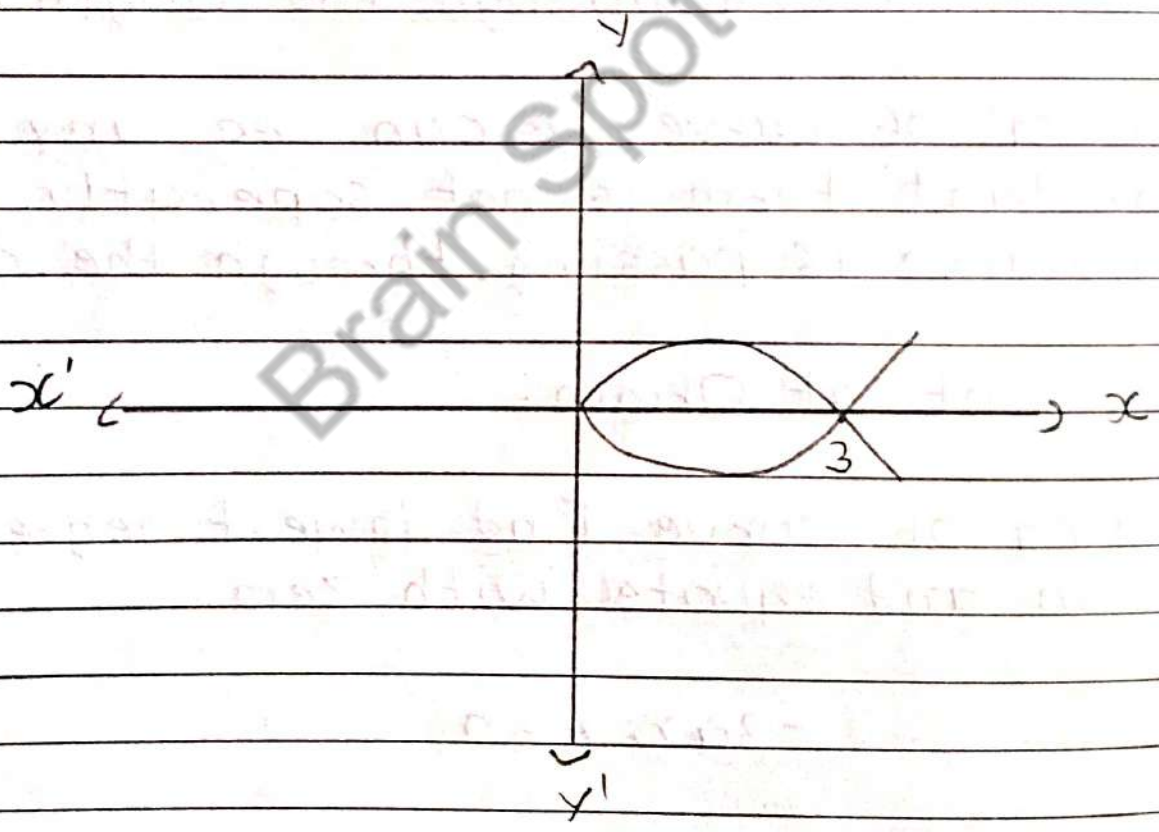

6 Region :

$$y^2 = \frac{x(x-3a)^2}{9a}$$

$$\therefore y = \frac{(x-3a)}{3} \sqrt{\frac{x}{a}}$$

$$0 \leq x \leq 3a$$

y become imaginary for  $0 \leq x < 3a$ .

$$6 \quad x^3 + y^3 - 3axy = 0$$

Given eq<sup>n</sup> of curve  $x^3 + y^3 - 3axy = 0$  - (1)

1 Symmetry: In the given eq<sup>n</sup> of curve, if we interchange  $x$  and  $y$  eq<sup>n</sup> of curve remain unchange.

So, Curve is symmetry above  $x = y$  line.

2 Curve passing through the Origin:

In eq<sup>n</sup> of curve we can see any constant term is not separately.

So, Curve is passing through the Origin.

3 Tangent at Origin:

In eq of curve Find lowest degree term and equate with zero.

$$\therefore -3axy = 0$$

$$\therefore x = 0, y = 0$$

At Origin we get 2 different tangent.  
So, Origin is become a node point.

4 Intersection with axis.

Intersection For  $Y = X$  line,  
take  $x = Y$  in eq<sup>n</sup> 1

$$\therefore x^3 + x^3 = 3ax^2$$

$$\therefore x = \frac{3a}{2}, \quad Y = \frac{3a}{2}$$

So, Curve into the  $Y = X$  line at  $\left(\frac{3a}{2}, \frac{3a}{2}\right)$

5 Region.

IF we take  $x = (-x)$  and  $Y = (-Y)$

So, Curve does not go in 3<sup>rd</sup> quadrant.

6 Asymptotes:

(i) Parallel to  $x$  axis = No

(ii) Parallel to  $Y$  axis = No

(iii) Oblique Asymptotes:  $Y = mx + c$

Now, For Asymptotes, we take

$$\phi_n(m) = \phi_3(m) = 1 + m^3$$

$$\therefore \phi_{n-1}(m) = \phi_2(m) = -3am$$

Now, we take  $\phi_n(m) = 0$

$$\therefore 1 + m^3 = 0$$

$$\therefore (m+1)(m^2 - m + 1) = 0$$

$m^2 - m + 1 = 0$  has imaginary root.

So,  $m+1 = 0$ ,  $m = -1$

Now C Find as Follow

$$C = \frac{-\phi_{n-1}(m)}{\phi'_n(m)} = \frac{-(C-3am)}{3m^2}$$

$$\therefore C = \frac{a}{m}$$

$$\therefore C = -a$$

Now oblique Asymptotes

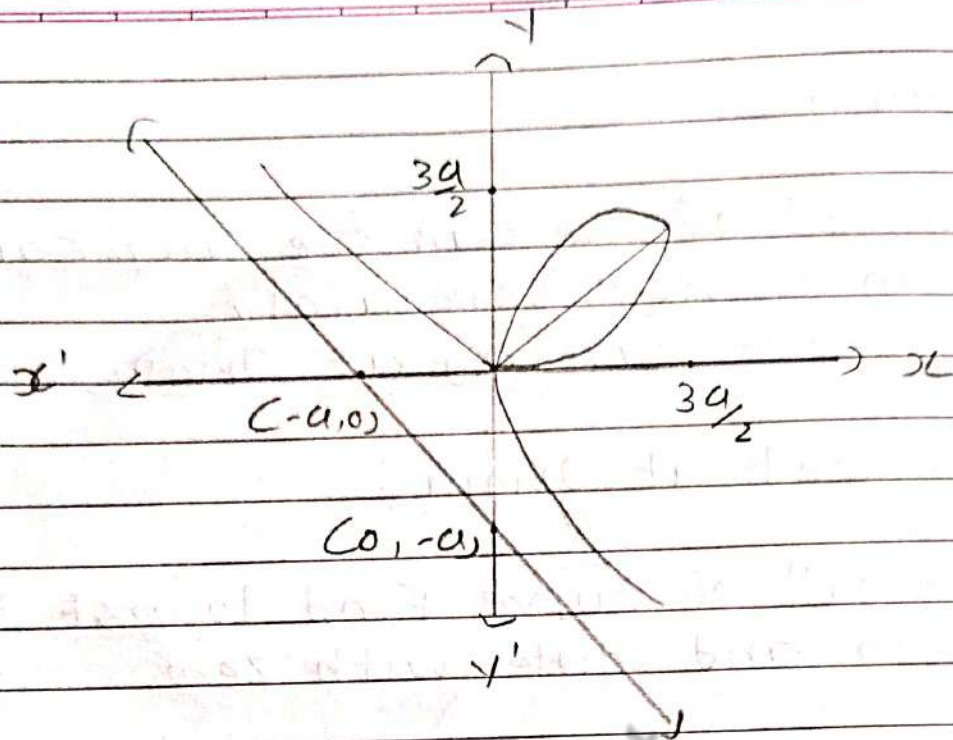

$$\therefore y = mx + c$$

$$\therefore y = -m - a$$

$$\therefore x + y = -a$$

$$\therefore (0, -a), (a, 0)$$

$$7 \quad y^2(a^2 + x^2) = x^2(a^2 - x^2)$$

Given eq<sup>n</sup> of curve  $y^2 a^2 + y^2 x^2 = x^2 a^2 - x^4$

### 1 Symmetry:

- In eq<sup>n</sup> of curve remains unchange when replasing  $x$  by  $-x$ . So the curve is Symmetry above  $y$  axis.
- In eq<sup>n</sup> of curve remains unchange when replasing  $x$  by  $-x$  and  $y$  by  $-y$ . So the curve has symmetry above opposite quadrant.
- In eq<sup>n</sup> of curve remains unchange when replasing  $y$  by  $-y$ . So the curve has symmetry above  $x$  axis.

### Origin:

In eq<sup>n</sup> of we can see any constant term is not separately.  
So, Curve passing at Origin.

### Tangent at Origin:

In eq<sup>n</sup> of curve Find lowest degree term and equate with zero.

lowest degree term is  $y^2 a^2 = 0$   
 $x^2 a^2 = 0$

$\therefore x = 0, y = 0$

two tangent are different So, Origin become a node.

### 4 Intersection with axis:

① For X axis: In eq<sup>n</sup> of curve putting  $y = 0$

$\therefore x^2 a^2 = x^4$

$\therefore x = a$

② For Y axis: In eq<sup>n</sup> of curve putting  $X = 0$

$$\therefore y^2 a^2 = 0$$

$$\therefore y = 0$$

5 Region:

$$y^2 = \frac{x^2 (a^2 - x^2)}{a^2 + x^2} \rightarrow y = x \sqrt{\frac{a^2 - x^2}{a^2 + x^2}}$$

$$x^2 = \frac{y^2 (a^2 + x^2)}{a^2 - x^2} \rightarrow x = y \sqrt{\frac{a^2 + x^2}{a^2 - x^2}}$$

$$-a \leq x \leq a$$

6 Asymptotes:

(i) Parallel to x axis: No

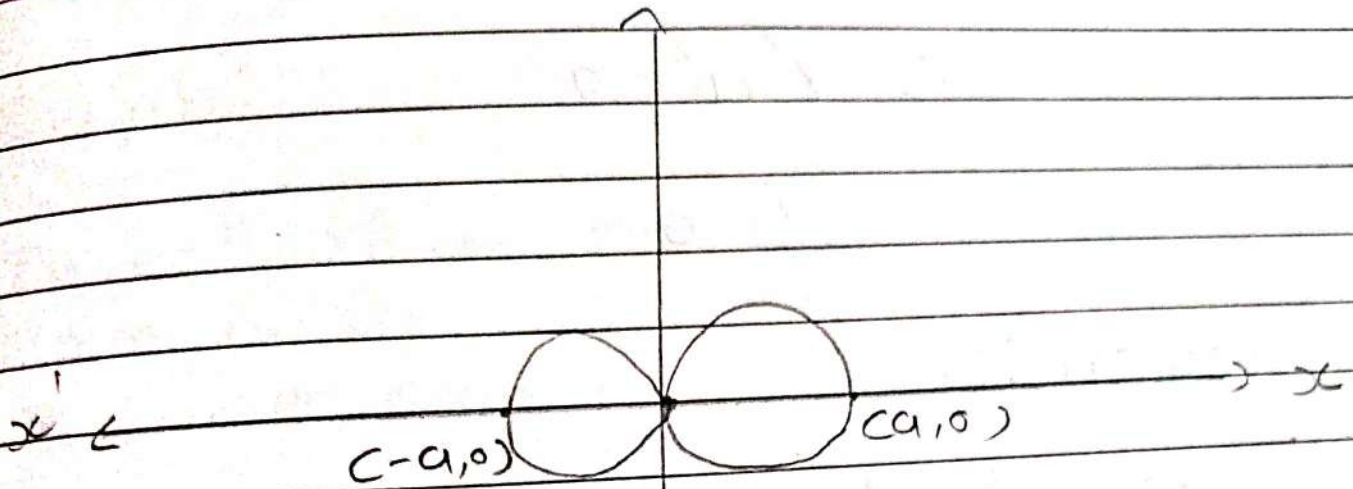

(ii) Parallel to y axis: No

(iii) Oblique Asymptotes:  $y = mx + c$

$$\phi_n(m) = \phi_2(m) = m^2 - 1$$

$$\therefore \phi_{n-1}(m) = \phi_1(m) =$$

## Unit-3 Curve Tracing

### \* Task 2: Polar curves

1  $r = a(1 - \cos\theta)$

Here given eq<sup>n</sup> of the curve is  $r = a(1 - \cos\theta)$ .  
We want to trace the curve by following steps.

1 Symmetry:

In eq<sup>n</sup> of curve remains unchange by replacing  $\theta$  by  $-\theta$ . that's why curve has initial line symmetry.

2 Passing through the Pole:

When we take  $r=0$  and eq<sup>n</sup> give such  $\theta$  then curve passing through the pole.

$$\therefore r = a(1 - \cos\theta)$$

$$\therefore a(1 - \cos\theta) = 0$$

$$\therefore 1 - \cos\theta = 0$$

$$\therefore \cos\theta = 1$$

$$\therefore \theta = 0$$

Here, we have such value of  $\theta$  that's why curve passing through the pole.

### 3 Tangent at Pole:

We take  $r=0$  and we get  $\theta=0$  then curve has tangent at Pole.

### 4 Direction of tangent:

Direction of tangent we find by formula,

$$\tan \phi = \frac{r}{dr/d\theta}$$

$$= \frac{a(1 - \cos\theta)}{a \sin\theta}$$

$$= \frac{1 - \cos\theta}{\sin\theta}$$

$$= \frac{2 \sin^2 \theta/2}{2 \sin\theta/2 \cdot \cos\theta/2}$$

$$= \frac{2 \sin^2 \theta/2}{2 \sin\theta/2 \cdot \cos\theta/2}$$

$$\tan \phi = \tan \frac{\theta}{2}$$

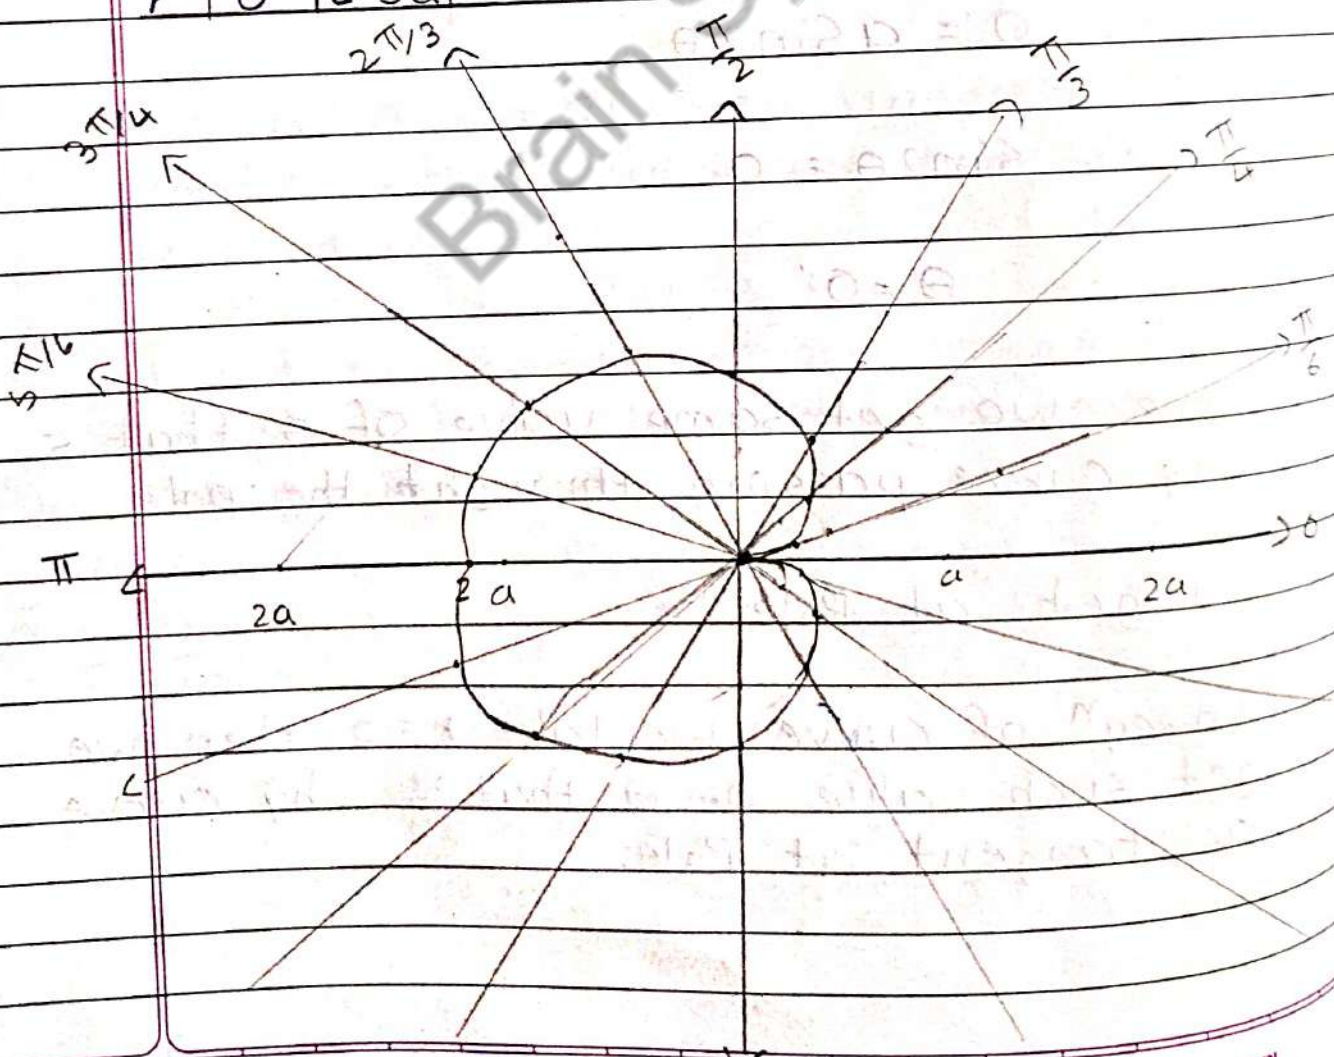

$$\therefore \phi = \frac{\theta}{2}$$

We take  $\theta = 0^\circ$  then  $\phi = 0$ , So radius and tangent vector are equal

We take  $\theta = \pi$  then  $\phi = \pi/2$ , So radius and tangent vector are perpendicular

5 table.

$\theta$	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	$\pi$
$r$	0	0.3a	0.29a	0.5a	a	1.5a	1.7a	1.86a	2a

2  $r = a \sin 2\theta$

1 Symmetry :

In eq<sup>n</sup> of Curve we change  $\theta$  by  $-\theta$  then eq<sup>n</sup> of Curve remain unchange that's why Curve as symmetry above initial line.

2 Passing through the pole :-

In eq<sup>n</sup> of Curve we take  $r=0$  then we get such  $\theta$  value.

$$\therefore 0 = a \sin 2\theta$$

$$\therefore \sin 2\theta = 0$$

$$\therefore \theta = 0$$

Here, we get same value of  $\theta$  that's why curve passing through the pole.

3 Tangent at Pole :

In eq<sup>n</sup> of curve we take  $r=0$  then we get such value of  $\theta$  that's why curve as tangent at Pole.

## 4 Direction of tangent

Direction of tangent we find by this formula.

$$\tan \phi = \frac{r}{dr/d\theta}$$

$$= \frac{a \sin 2\theta}{2a \cos 2\theta}$$

$$\tan \phi = \frac{1}{2} \tan 2\theta$$

$$\phi = \theta$$

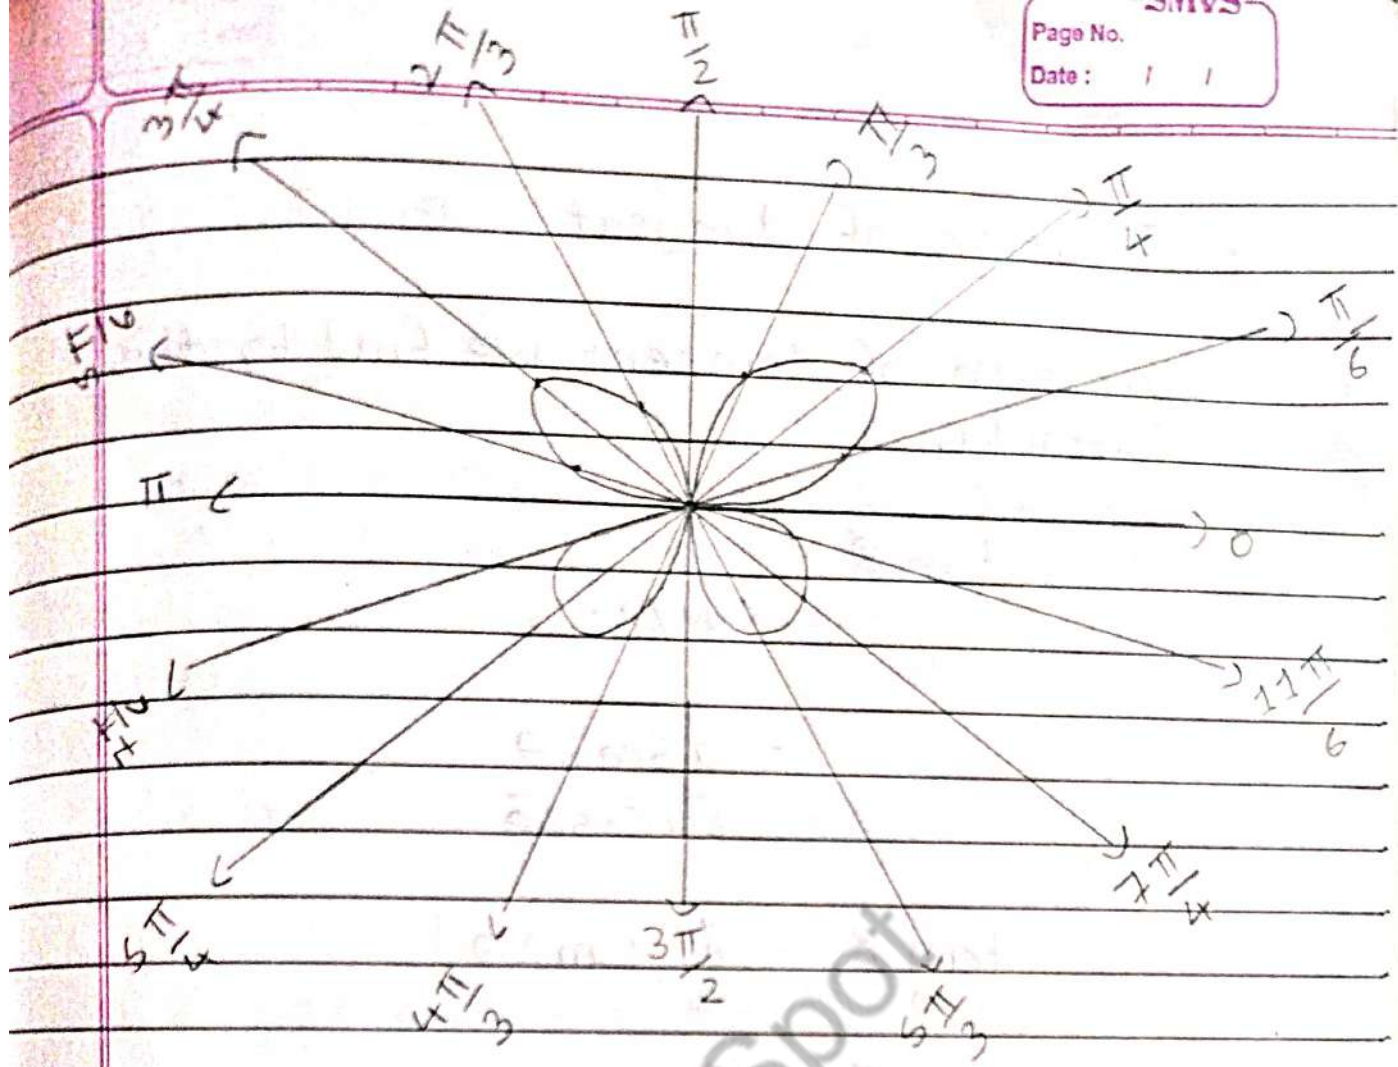

We take  $\theta = 0$  then we get  $\phi = 0$  that's why radius and tangent vector are equal.

We take  $\theta = \pi/2$  then we get  $\phi = \pi/2$  that's why radius and tangent vector are perpendicular.

## 5 Table :

$\theta$	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	$\pi$
$r$	0	$\frac{a}{2}$	$a$	$\frac{a\sqrt{3}}{2}$	0	$-\frac{a\sqrt{3}}{2}$	$-a$	$-\frac{a}{2}$	0

3  $r^2 = a^2 \cos 2\theta$

1 Symmetry: In given eq<sup>n</sup> of we replasing  $\theta$  by  $-\theta$  then eq<sup>n</sup> of curve remain unchange then curve has symmetry above intal line.

If eq<sup>n</sup> of curve we replasing  $r$  by  $-r$  and  $\theta$  by  $-\theta$  then eq<sup>n</sup> of curve remain unchange that's why curve has symmetry above  $\pi/2$  line.

2 Passing through the pole:

In eq<sup>n</sup> of Curve we take  $r=0$  then we get such value of  $\theta$

$$\therefore r^2 = a^2 \cos 2\theta$$

$$\therefore a^2 \cos 2\theta = 0$$

$$\therefore \cos 2\theta = 0$$

$$\therefore \theta = \frac{\pi}{2}$$

We get such value of  $\theta$  that's why curve passing through the pole.

### 3 Tangent at Pole:

We take  $r=0$  then we get such value of  $\theta$  that's why curve has tangent at Pole.

### 4 Direction of tangent:

Find Direction of tangent use by this formula.

$$r = a \sqrt{\cos 2\theta}, \quad \frac{dr}{d\theta} = \frac{-a \cdot 2 \cos 2\theta \cdot \sqrt{\sin 2\theta}}{2 \sqrt{\cos 2\theta}}$$

$$= -a \sqrt{\sin 2\theta}$$

$$\therefore \tan \phi = \frac{r}{dr/d\theta} = \frac{a \sqrt{\cos 2\theta}}{-a \sqrt{\sin 2\theta}}$$

$\therefore \tan \theta = -\cot 2\theta$

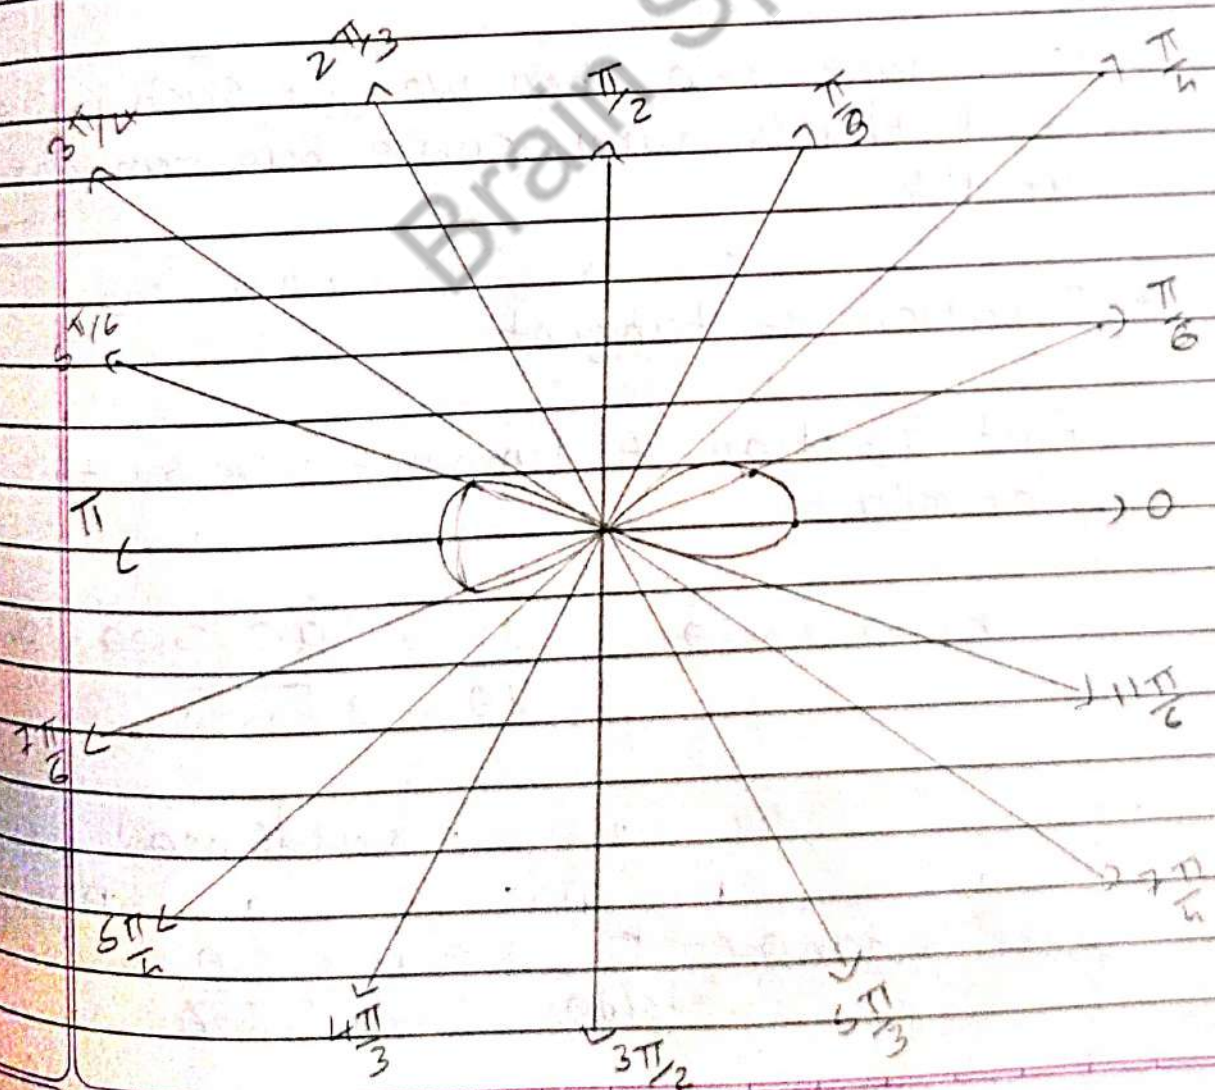

5 Region: Here given eq<sup>n</sup> curve  $r^2 = a^2 \cos 2\theta$  and we know that  $\cos \theta$  +ve in 1<sup>st</sup> and 4<sup>th</sup> quadrant.

Now,  $-\frac{\pi}{2} \leq 2\theta \leq \frac{\pi}{2}$

$\therefore -\frac{\pi}{4} \leq \theta \leq \frac{\pi}{4}$

6 table:

$\theta$	0	$\pi/6$	$\pi/4$	$3\pi/4$	$5\pi/6$	$\pi$
$r$	a	0.7a	0	0	0.7a	a

4  $r = a \sin 3\theta$

1 Symmetry :

In eq<sup>n</sup> of curve we replasing  $\theta$  by  $-\theta$  then eq<sup>n</sup> of curve remain unchang that's why curve has symmetry above initial line.

In eq<sup>n</sup> of Curve we replasing  $\theta$  by  $\pi - \theta$  then eq<sup>n</sup> of curve remain unchange that's why curve has symmetry above  $\pi/2$  line.

2 Passing through the Pole

We take  $r = 0$  then we get such value of  $\theta$

$$\therefore r = a \sin 3\theta$$

$$\therefore a \sin 3\theta = 0$$

$$\therefore \theta = 0$$

3 To Here, we get such value of  $\theta$  then curve has passing through the pole.

### 3. Tangent at Pole:

We take  $r=0$  then we get such value of  $\theta=0$  that's why curve is tangent at Pole.

### 4. Direction of tangent:

We find direction of tangent by use this formula.

$$\begin{aligned} \tan \phi &= \frac{r}{dr/d\theta} \\ &= \frac{a \sin 3\theta}{3a \cos 3\theta} \end{aligned}$$

$$\therefore \tan \phi = \frac{1}{3} \tan 3\theta$$

$$\therefore \phi = \theta$$

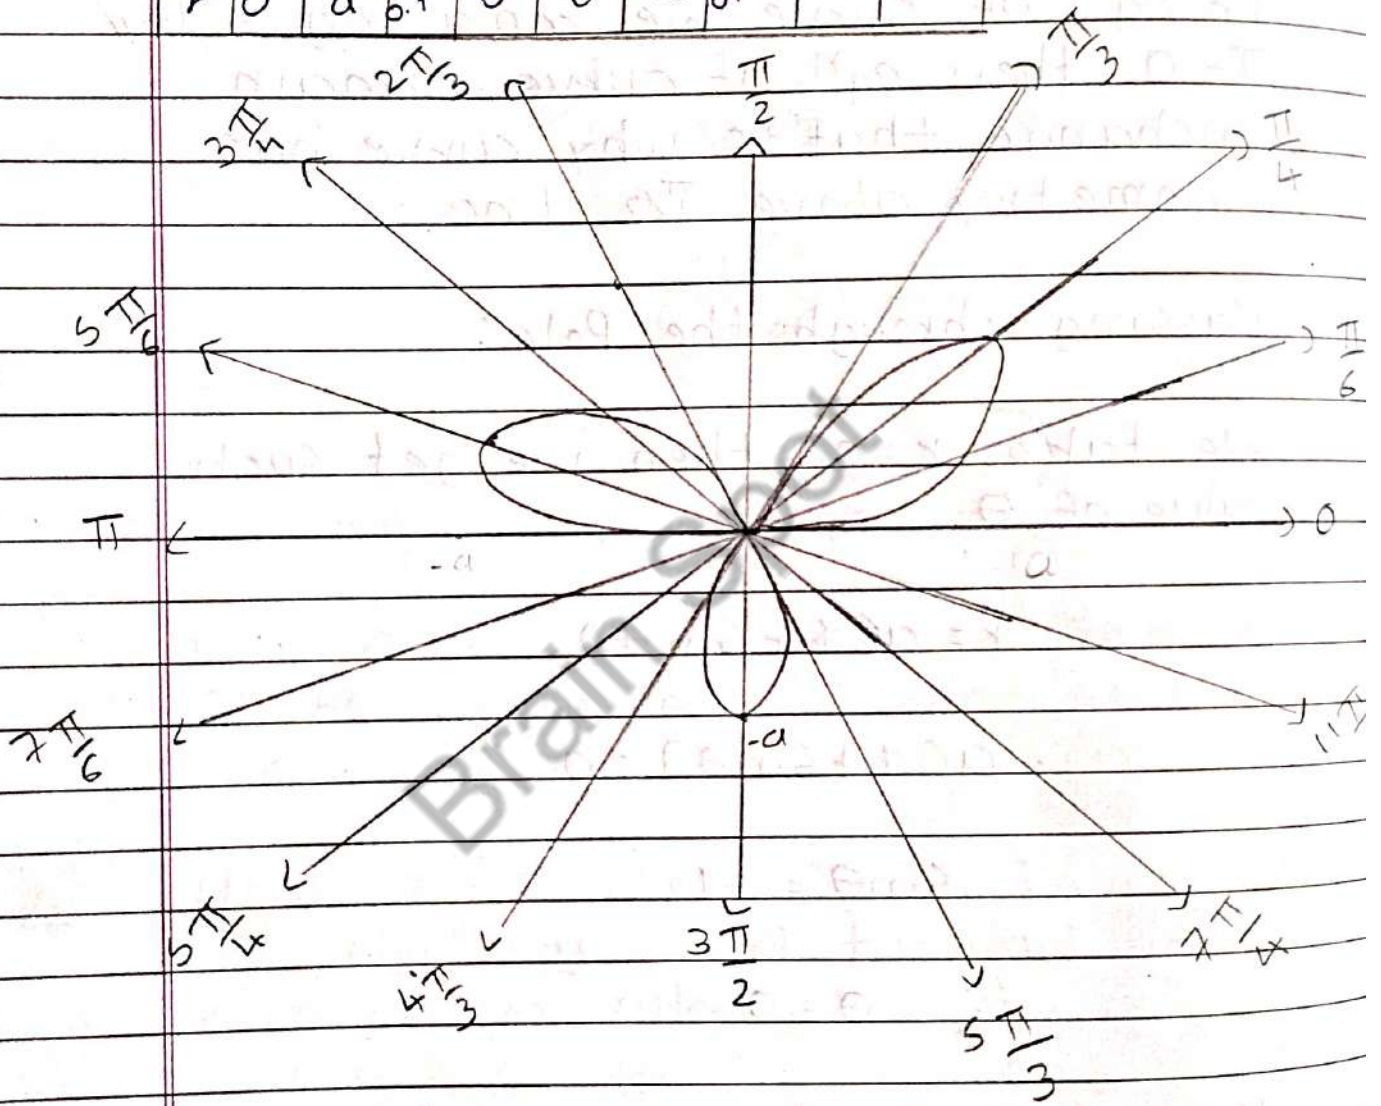

We take  $\phi=0$  then  $\theta=0$ . So, radius and tangent vector are perpendicular equal.

We take  $\phi=\pi/2$  then  $\theta=\pi/2$ . So, radius and tangent vector are perpendicular.

5 Table:

$\theta$	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	$\pi$
$r$	0	a	$0.7^a$	0	-a	-a	$0.7^a$	a	0

$$5 \quad r = a(1 + \sin\theta)$$

### 1 Symmetry :

In eq<sup>n</sup> of curve we replasing  $\theta$  by  $\pi - \theta$  then eq<sup>n</sup> of curve remain unchange that's why curve has symmetry above  $\pi/2$  line.

### 2 Passing through the Pole :

We take  $r=0$  then we get such value of  $\theta$

$$\therefore r = a(1 + \sin\theta)$$

$$\therefore a(1 + \sin\theta) = 0$$

$$\therefore \sin\theta = -1$$

$$\therefore \theta = \pi$$

Here, such  $\theta$  value are exist that's why curve passing through the Pole.

### 3 Tangent at Pole :

We take  $r=0$  and we get such value of  $\theta = \pi$  so, curve has tangent at Pole.

#### 4 Direction of tangent

Direction of tangent we find by this formula,

$$\begin{aligned} \therefore \tan \phi &= \frac{r}{dr/d\theta} \\ &= \frac{a(1 + \sin\theta)}{a \cos\theta} \\ &= \frac{1 + \sin\theta}{\cos\theta} \end{aligned}$$

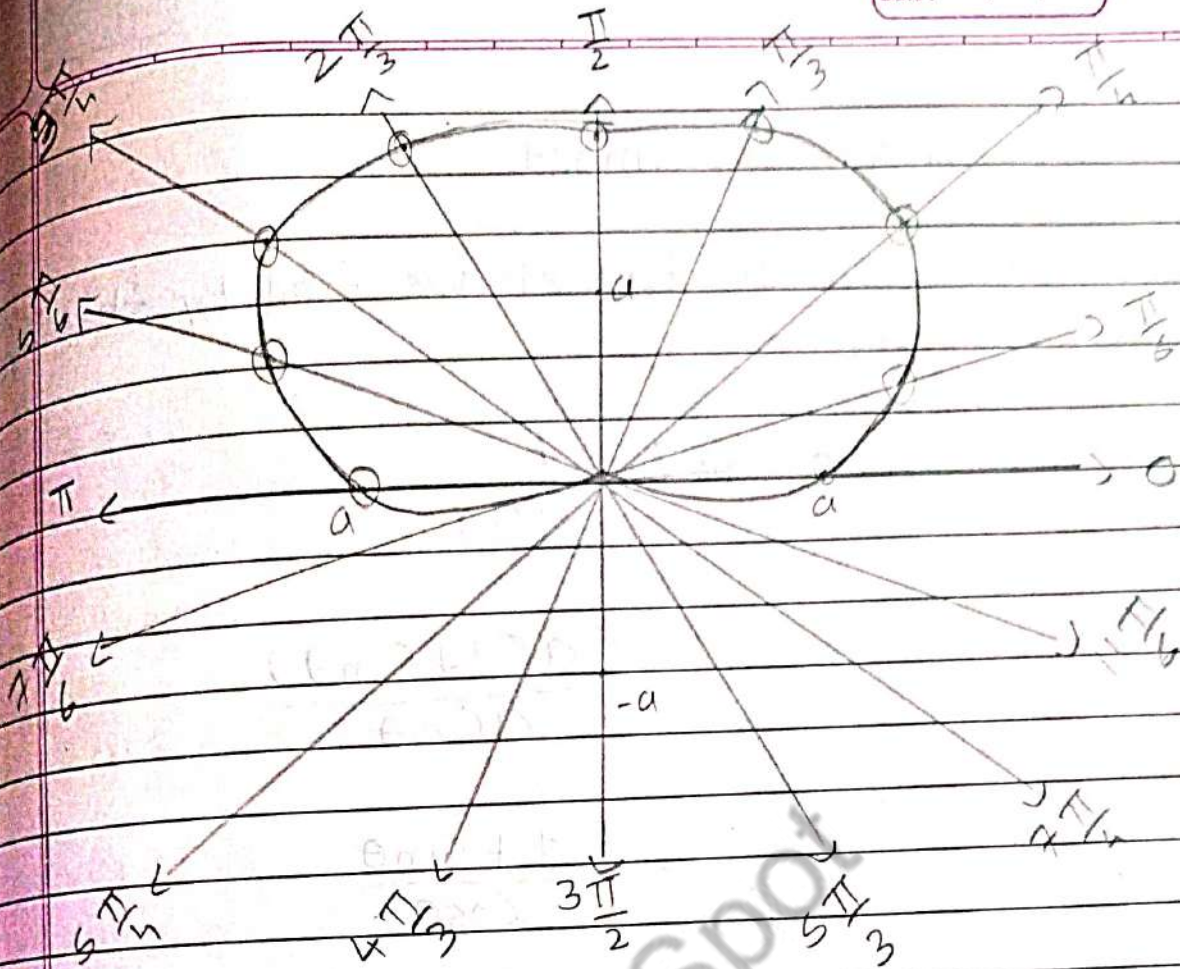

Here,  $\theta \rightarrow 0$ , then  $\tan \phi = 0$ , then  $\phi = 0$   
So, the radius and tangent vector are equal.

Here,  $\theta \rightarrow \pi$  then  $\phi = \pi/2$ .  
So, the radius and tangent vector are perpendicular.

#### 5 Table:

$\theta$	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	$\pi$
$r$	$a$	$1.5a$	$1.7a$	$1.86a$	$2a$	$1.86a$	$1.7a$	$1.5a$	$a$

$$6 \quad r = a \cos 2\theta$$

1 Symmetry :

In given eq<sup>n</sup> of curve we replasing  $\theta$  by  $-\theta$  eq<sup>n</sup> of curve remain unchange then curve has symmetry above initial line.

2 Passing through the Pole :

given eq<sup>n</sup> of curve we take  $r=0$  then we get such value of  $\theta$

$$\therefore r = a \cos 2\theta$$

$$\therefore a \cos 2\theta = 0$$

$$\therefore 2\theta = \pi$$

$$\therefore \theta = \frac{\pi}{2}$$

Here, we get  $\theta = \pi/2$  then eq<sup>n</sup> of curve passing through the Pole.

### 3 Tangent at Pole:

We take  $r = 0$  then we get  $\theta = \pi/2$ .  
So, curve has tangent at Pole.

### 4 Direction of tangent

Direction of tangent we find use of this formula,

$$\tan \phi = \frac{r}{dr/d\theta}$$

$$= \frac{a \cos 2\theta}{-2a \sin 2\theta}$$

$$= -\frac{1}{2} \cot 2\theta$$

Here, we take  $\theta = \pi/2$  then  $\phi = 0$ .  
 So, radius and tangent vector are equal.

We take  $\theta = 0$  then  $\phi = \pi/2$   
 so, radius and tangent vector are perpendicular.

Table

$\theta$	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	$\pi$
r	1a	0.5a	0	-0.5a	-0.6a	-0.8a	-0.9a	-1a	1a
